SEED START

PLANT HEALTH FROM
GERMINATION TO HARVEST

SeedStart from Soil Mender is a seed treatment package comprised of beneficial microbes, soluble carbon, L-amino acids, and other compounds targeting plant health, promoting a quick and sustained germination process. After germination this team continues to provide a host of benefits to the growing plant by enhancing the fundamental relationship between the soil and the plant. Biochemical signals (enzymes) are given off by this all-star microbial team communicating with the plant, invoking a more robust root mass and vigorous plant.

WHY SEEDSTART

- Improves root development through biological and genetic means
- Improves colonization of microbes around growing roots
- Enhances germination and shoot growth
- Creates a healthier plant able to defend against abiotic and biotic stresses

2020 RESULTS

Cotton - 92 lb avg yield advantage
Sorghum - 749 lb yield advantage

2021 RESULTS

Corn - 3.7 bu avg yield advantage
8 Comparisons

Sorghum - 325 lb yield advantage

Cotton - 1250 plants per acre more
8 Locations, 96 Counts
